

Testplan website

Robin Friesen – Personal Project

Introduction

For the personal project I'm creating a portfolio website where I'll publish all of the deliverables of this semester. To know if the website is clear and works intuitive, I will do a test with several of the students at FHICT.

Usability test

The first part of the test is a usability test. The test user has to use my website and run certain scenario's to find out if my website works as it should.

The test starts with a short introduction text: 'You're going to test my personal portfolio website for the Advanced Media Semester. I will give you a scenario (what you should do on the website), and you have to try to run this scenario.'

Scenarios

Write the correct or incorrect completion down for each scenario.

1. Go to the page with all of the deliverables of the Samen aan Z project.
2. Go to a deliverable and find the conclusion.
3. Find the learning outcome(s) that this deliverable is evidence for.
4. Go back to the home page.
5. ~~Go to the About Me section.~~

Addition after first test

6. Go to the evidence table.

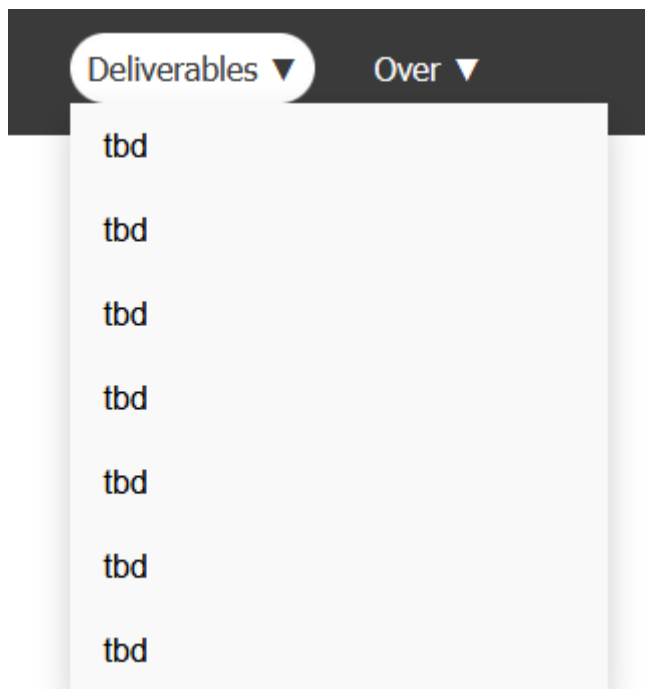

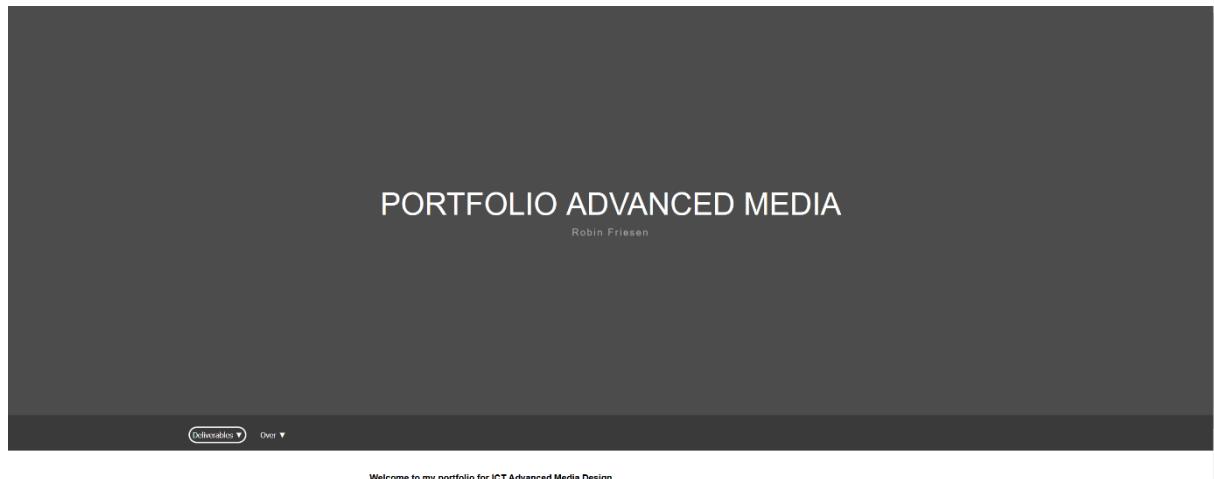

At the end of the test I will ask if the user has any additional comments.

A/B test

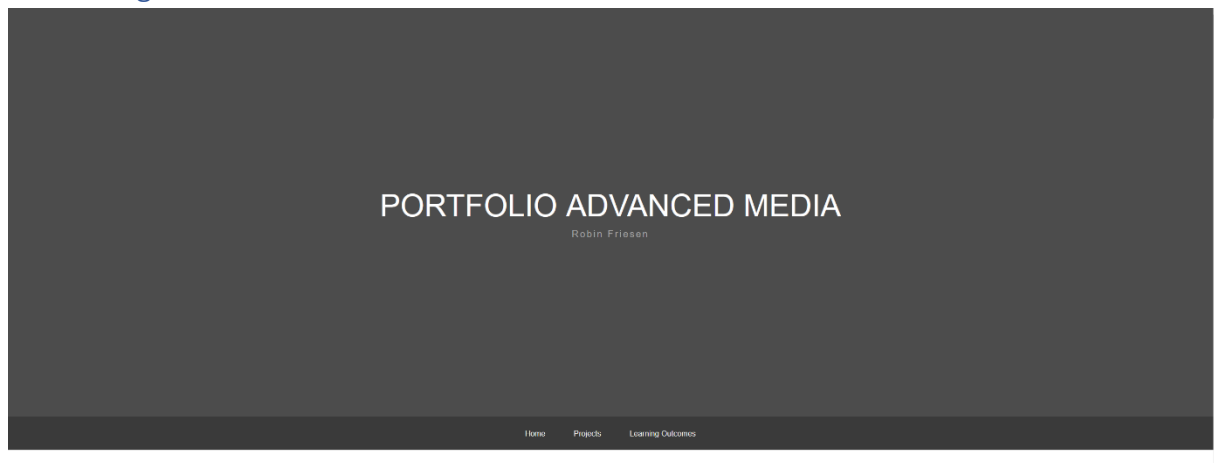

During this test I will show the test user two different designs for the navigation bar: my old design and my new design. The user will have to choose their favorite option, and tell my why this is their favorite option.

Below are the two versions that I will show to the users. I will mix their location every test to make sure that the location of the version doesn't impact the result.

Old design

New design
